

VII. Institutional and Other Issues

1). The current spatial data being supplied for GIS projects needs to be validated and processed. The raw data as it is received is not accurate due to the wide range of data provided statewide. The Prefire Engineer is working on validating this data with the assistance of a part-time GIS Tech trainee when available. With the introduction of a new GIS-based dispatch system, it is imperative that the data be maintained in an accurate form. A new GIS position will need to be established to ensure accuracy of data received, and to provide maintenance and upkeep of this information.
